

Toyota Hilux with a high ground clearance that runs petrol that takes us around all of the farm

How much water is needed to run a 400-acre livestock farm. Each of our 160 cows consumes about 100 liters of water per day, we need over 16,000 liters each day. We have 400 goats on the farm and each goat consumes about 4 liters of water per day for 1,600 liters/day. Then we have water consumed by the people on the farm, for cleaning, bathing, for the chickens and more for about 20,000 liters/day.

We had 4 boreholes dug and fitted across the farm for our water needs. We then have a network of water pipes around the farm to supply water to the necessary places.
