\*For consultation, one on one coaching on poultry management call us

You need to calculate the eggs being produced per hour, day, month

You must keep the poultry environment clean every day, change your tops for the birds every 3 days to reduce smell and odor in the pen.

You also need to do rubbing of the food to make them think there is new food. This will make them come out to eat thinking there is new food

We buy each layer bird for N2250 plus transportation, you must learn to monitor all your birds.

This feed is N5,800 per bag and we feed them a minimum of 3 bags/day so that they can hit maximum productivity. Ensure your birds have adequate water with multivitamins, antibiotics and vaccines in it.

The waste is also packed and sold as fertilizer, a bag is sold for about N1,500-N1,600 when dry. We can sell about 60 bags per month. The waste is packed, dried and bagged every 3-4 days to have a clean floor and reduce contamination.

You need to check the chicken waste for diseases and infection. Green and yellow waste is good.

You need to check the neck and weight of the birds to make sure they are not sick.

You need to have an isolation area for birds that might be sick, monitor them there and nurse them back to health. Some of the birds might prefer to eat from the ground.

You need proper ventilation and rat-proofing the poultry area itself (from floor and the roof) to prevent disease transfer to your chicken.

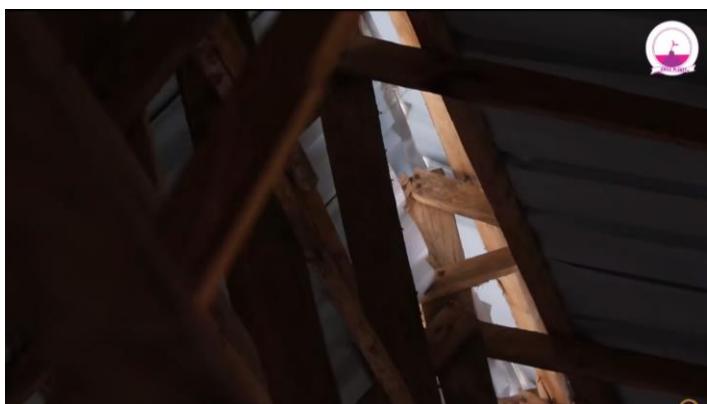

Use nets to seal your farm roof

Don't keep their drugs in the sun and always use a clean syringe when putting the drugs into their water. Always ask the Vet doctor the exact amount of drugs to apply using the syringe to measure out.

This board is for staff training continuously. These are the water purifiers

The shoes MUST not leave the pen they are meant for

This is a disinfectant water that contains Izal.

This cat is another security for rats

This is an isolation center for all our sick birds that can't eat in the battery cage. The birds are fed and monitored here before taking them back.

Feed price goes up in December, you can stock up broiler and layer feeds when prices are down.

We buy enough feeds for about 3 months to reduce our risks of market price fluctuations, current price is N5,800/bag.

We use this scale to weigh the birds when it's time to sell them, we also stock some drugs that might be difficult to find

We also use this sprayer to disinfect our farm pens and area when we sell and clear out the broilers and layers.

We will have our fish pond once stocked

We have a generator (7pm-10pm) and solar (10pm-6am) room, solar charges batteries during the day to run the lights.
